**E-A Modeling**

Lab companion slides

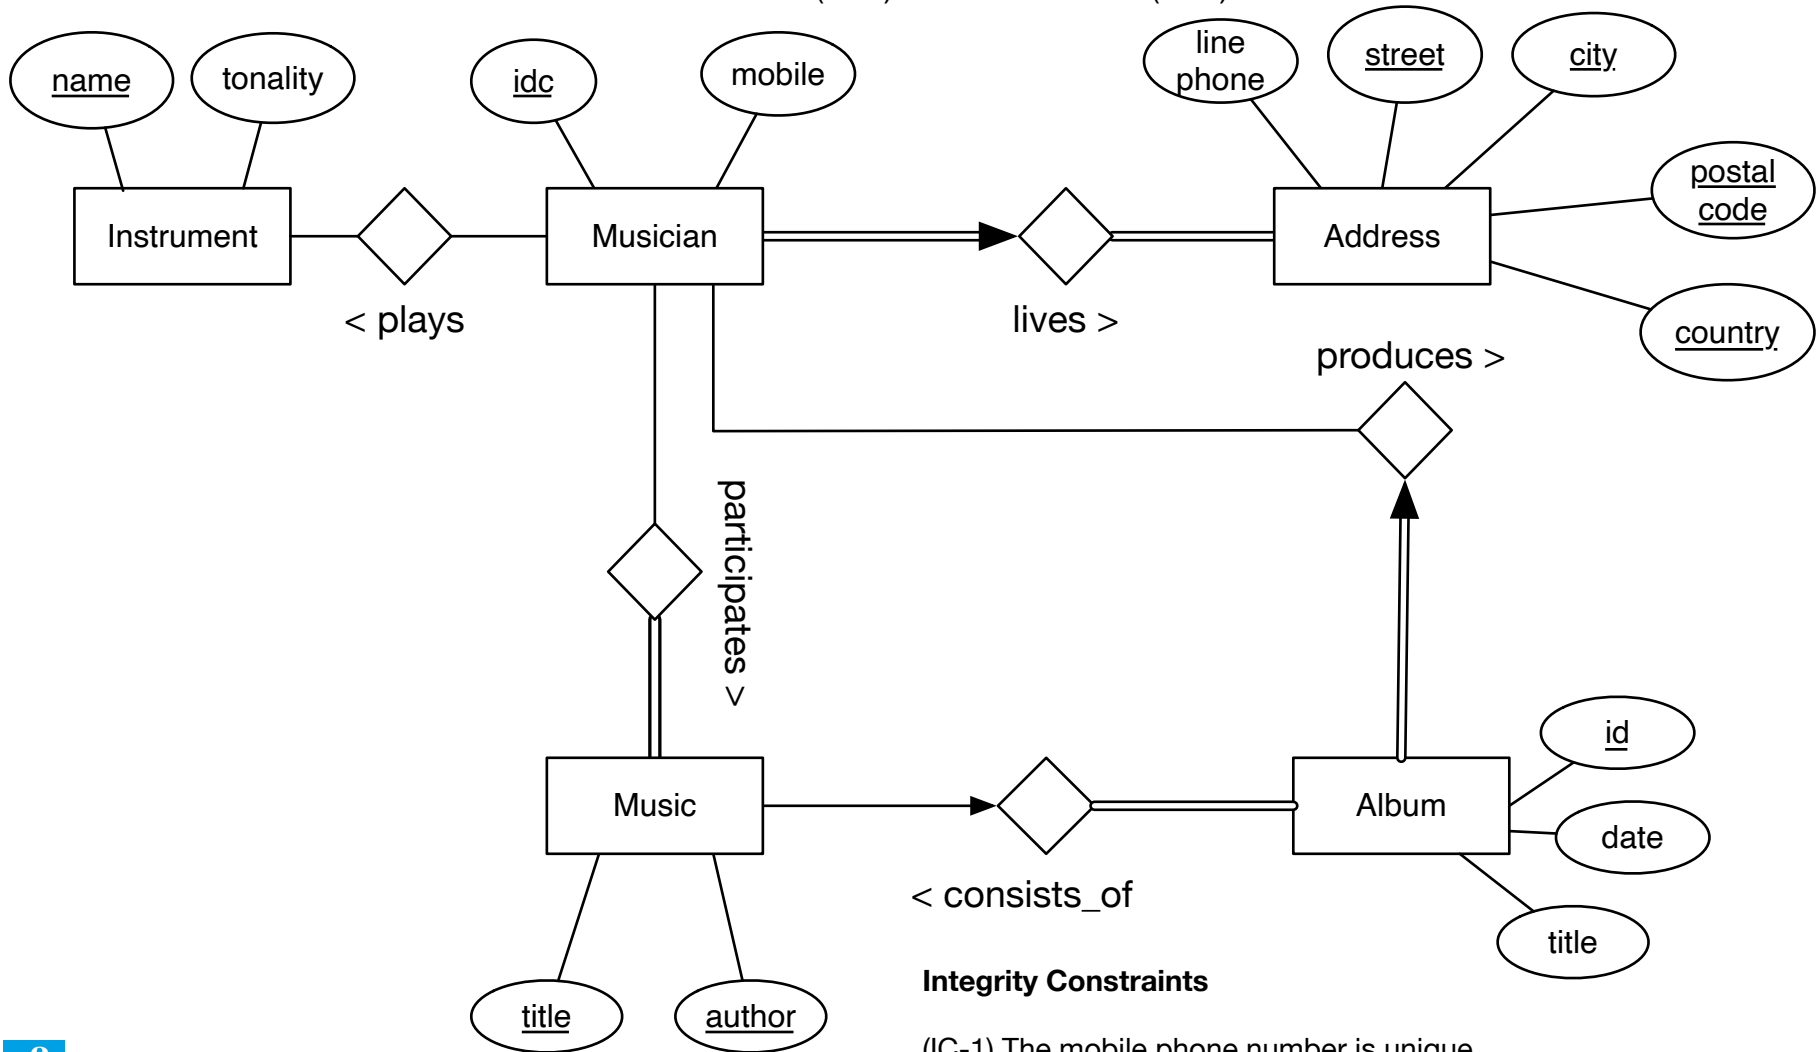

# Solution for E-A Scenario 1

# Attribute vs. Entity

- ▶ Create an entity from an attribute whenever:
  - There is more than one value for the attribute for each instance of the Entity
  - The attribute has its own structure (sub-attributes)
  - The value of the attribute must be shared by multiple entities
- ▶ Example: address as attribute
  - Employees have more than one address
  - An address consists of the attributes: Street, city, country ...
  - Some Employees share the same address

# Scenario 1

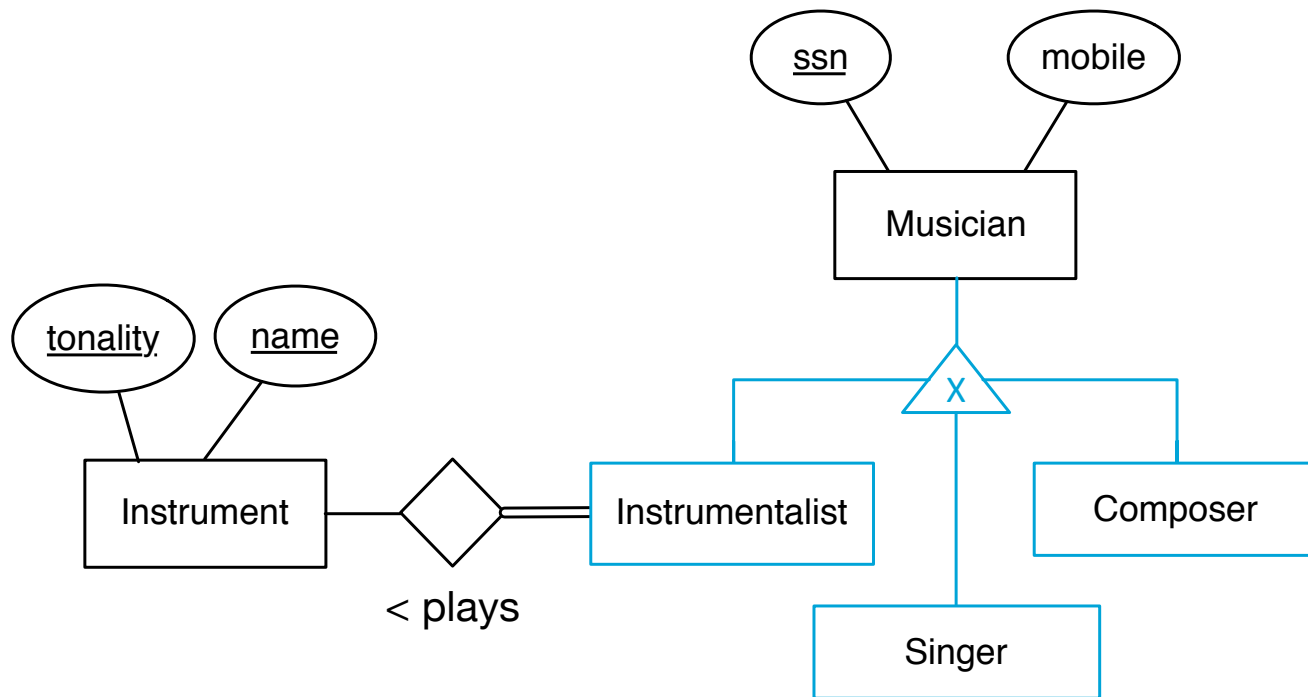

## Integrity Constraints

(IC-1) The mobile phone number is unique

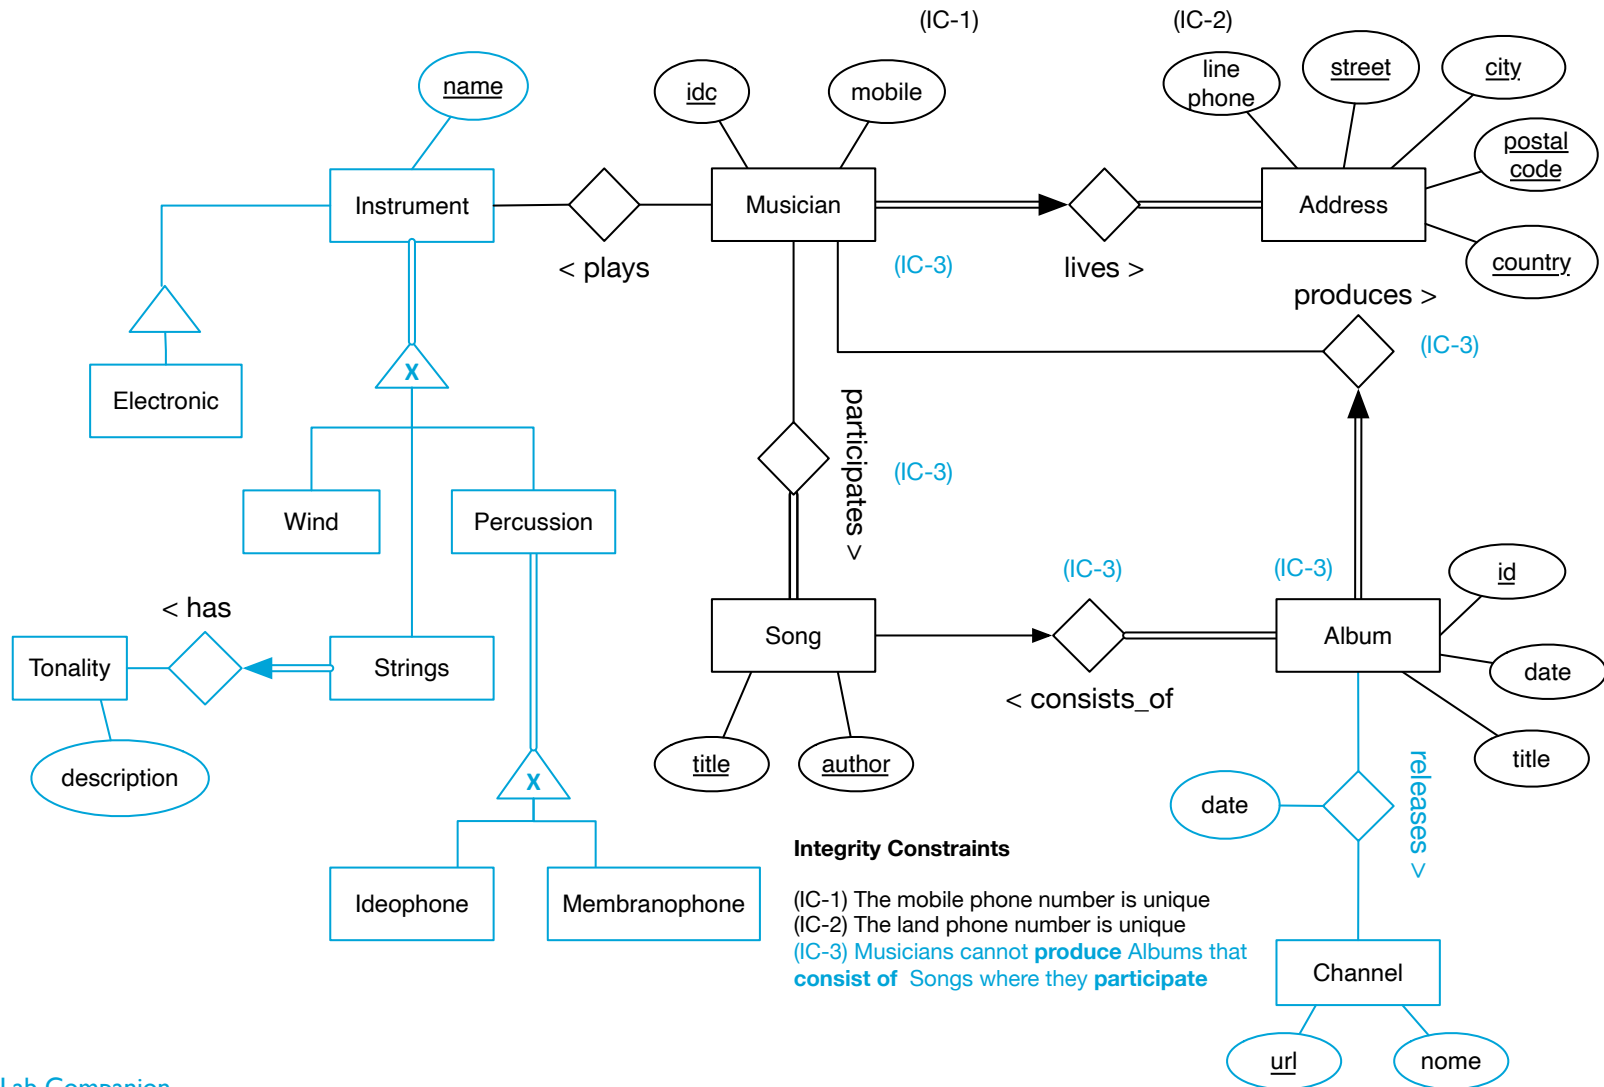

(IC-2) The land phone number is unique

# Scenario 1: Alternative

# Solution for E-A Scenario 2

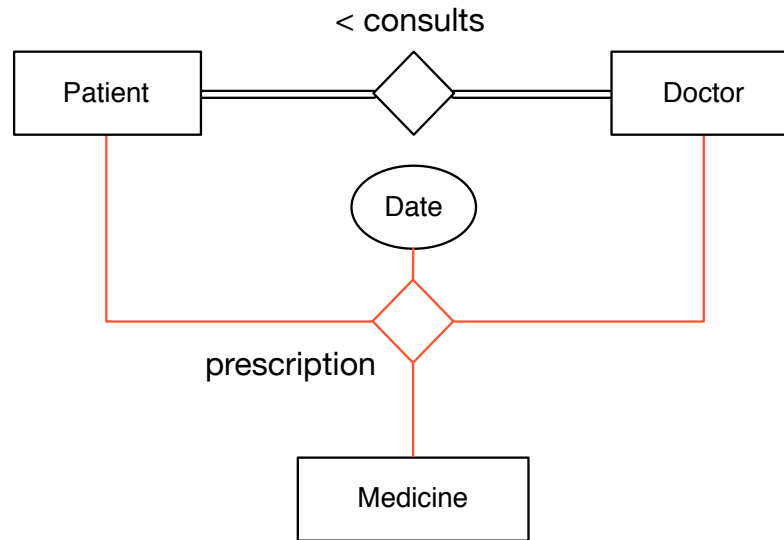

# Scenario 2

# Solution for E-A Scenario 3

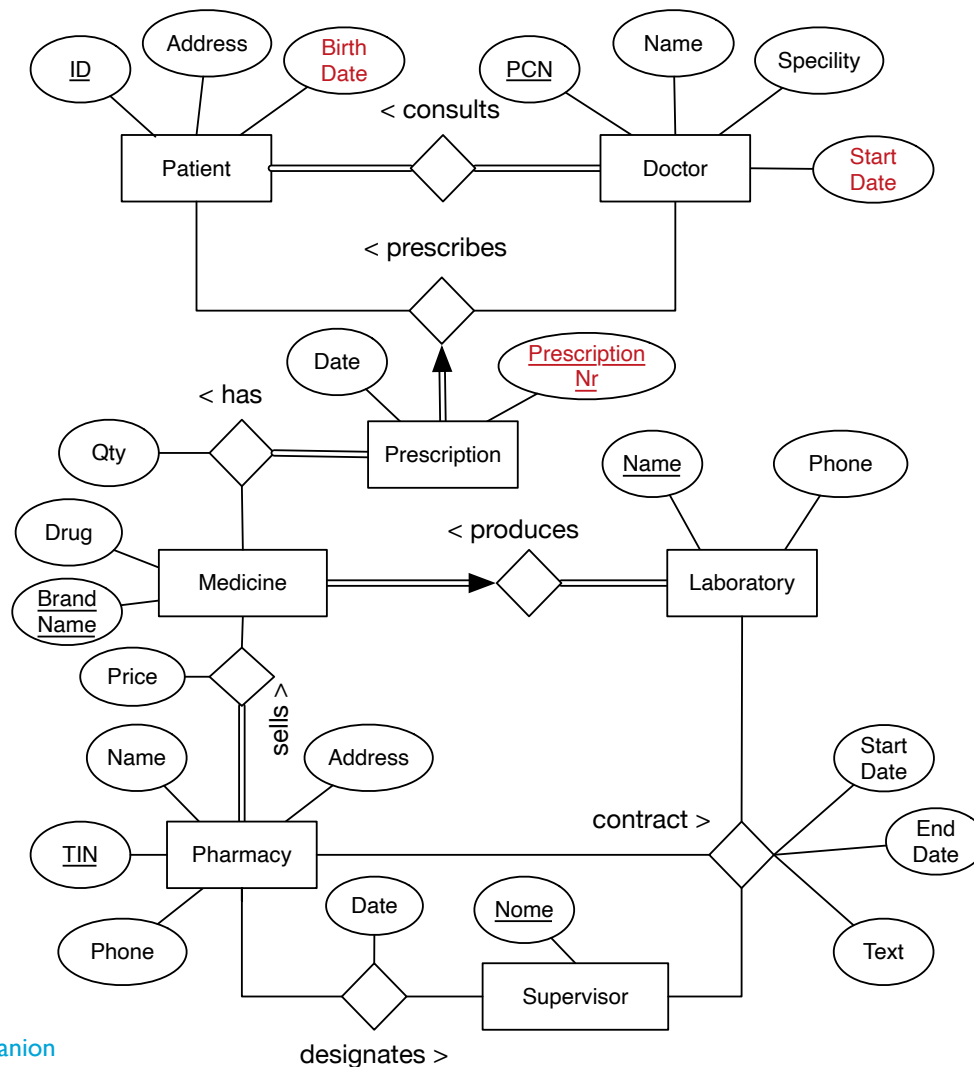

# Can a receipt be Ternary?

- ▶ **Prescription** cannot be ternary association because, if that is the case, then each recipe can only have one Medicine associated.
- ▶ Prescribing multiple medicines would require instantiating the association several times, therefore implicitly creating multiple prescriptions

# Scenario 3

Depending on the interpretation of the problem, the attributes in red could be added to the entities

What is missing?

ICs are missing

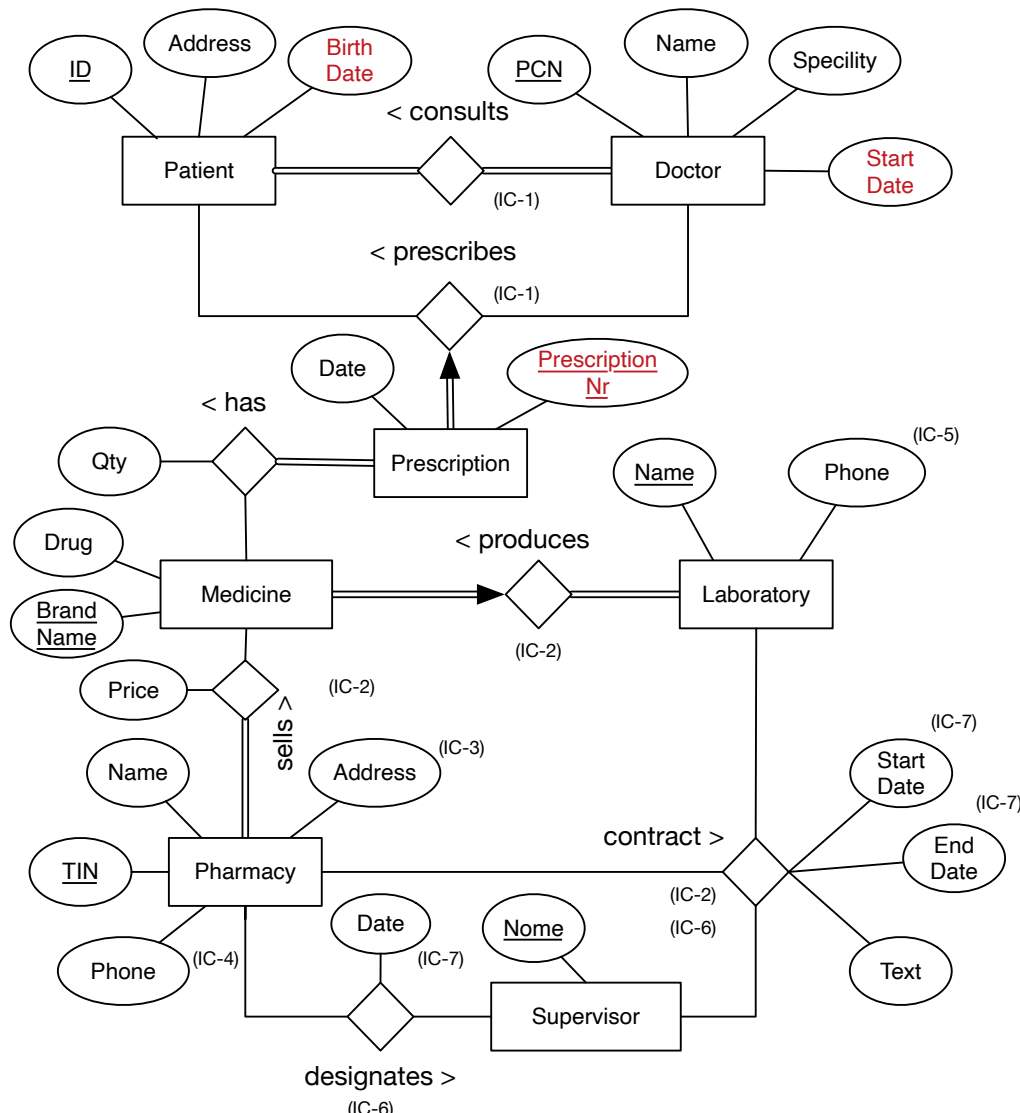

# Integrity Constraints

- IC-1: A Prescription can only be **prescribed** to a Patient by a Doctor who **consults** it
- IC-2: A Pharmacy can only **sell** Medicines **manufactured** by Laboratories with which it has **contracts**
- IC-3: The address of a Pharmacy is unique
- IC-4: The phone number of a Pharmacy is unique
- IC-5: The phone number of the Laboratory is unique

# Integrity Constraints

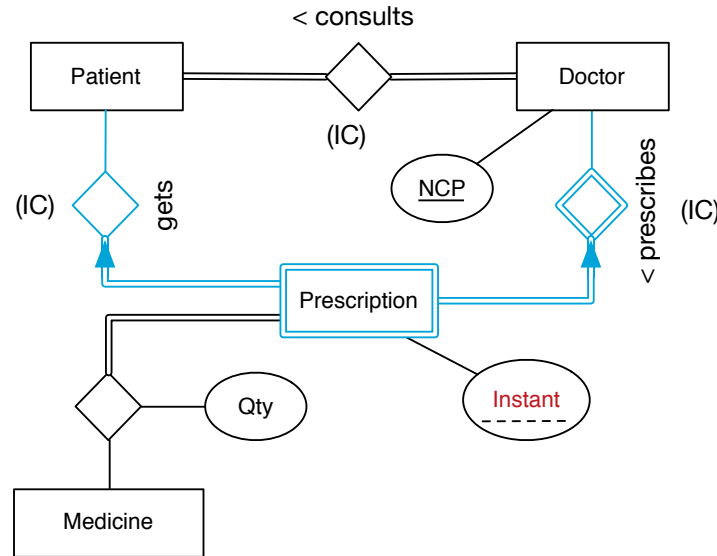

- IC-6: A Supervisor may only be **designated** by a Pharmacy for **contracts** established with the Pharmacy
- IC-7: The **start date** of the designation can not be earlier than the **start date** of the contract nor later than the **end date** of the contract

# Solution with ICs

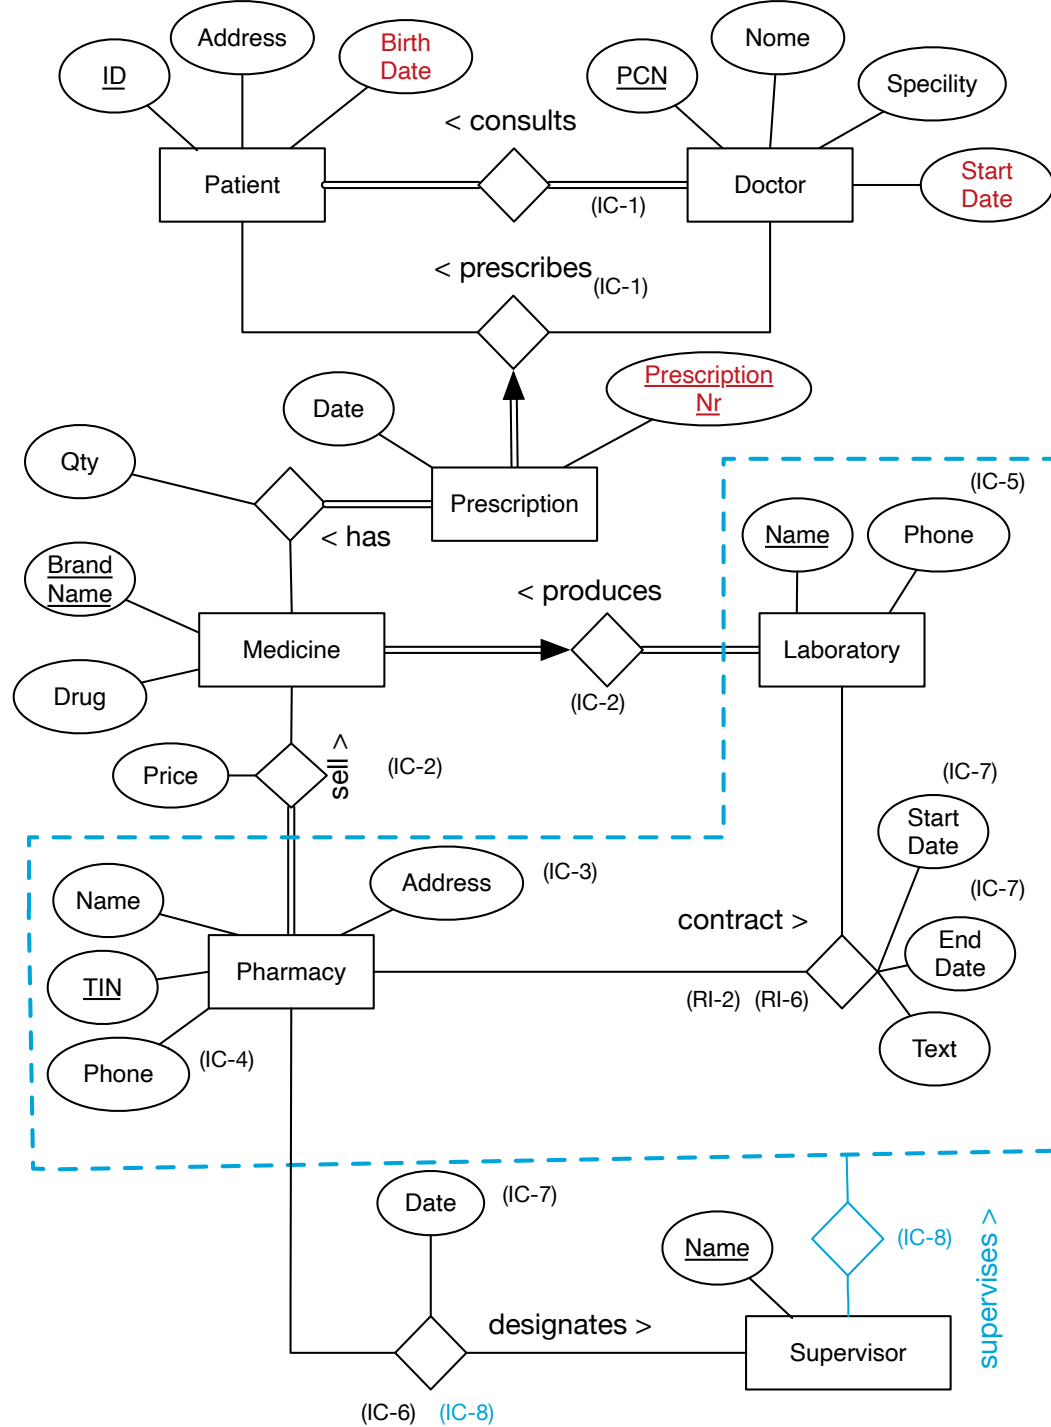

Depending on the interpretation of the problem, the attributes in red could be added to the entities

# Receipt as a Weak Entity

- The prescription is “comes” from a doctor
- The prescription can be a weak entity of Doctor because no doctor can prescribe two prescriptions at the same time
- The date is actually date + time (instant)
- IC: A Patient can only receive a **prescription** from the a doctor who follows it

# Solution for E-A Scenario 4

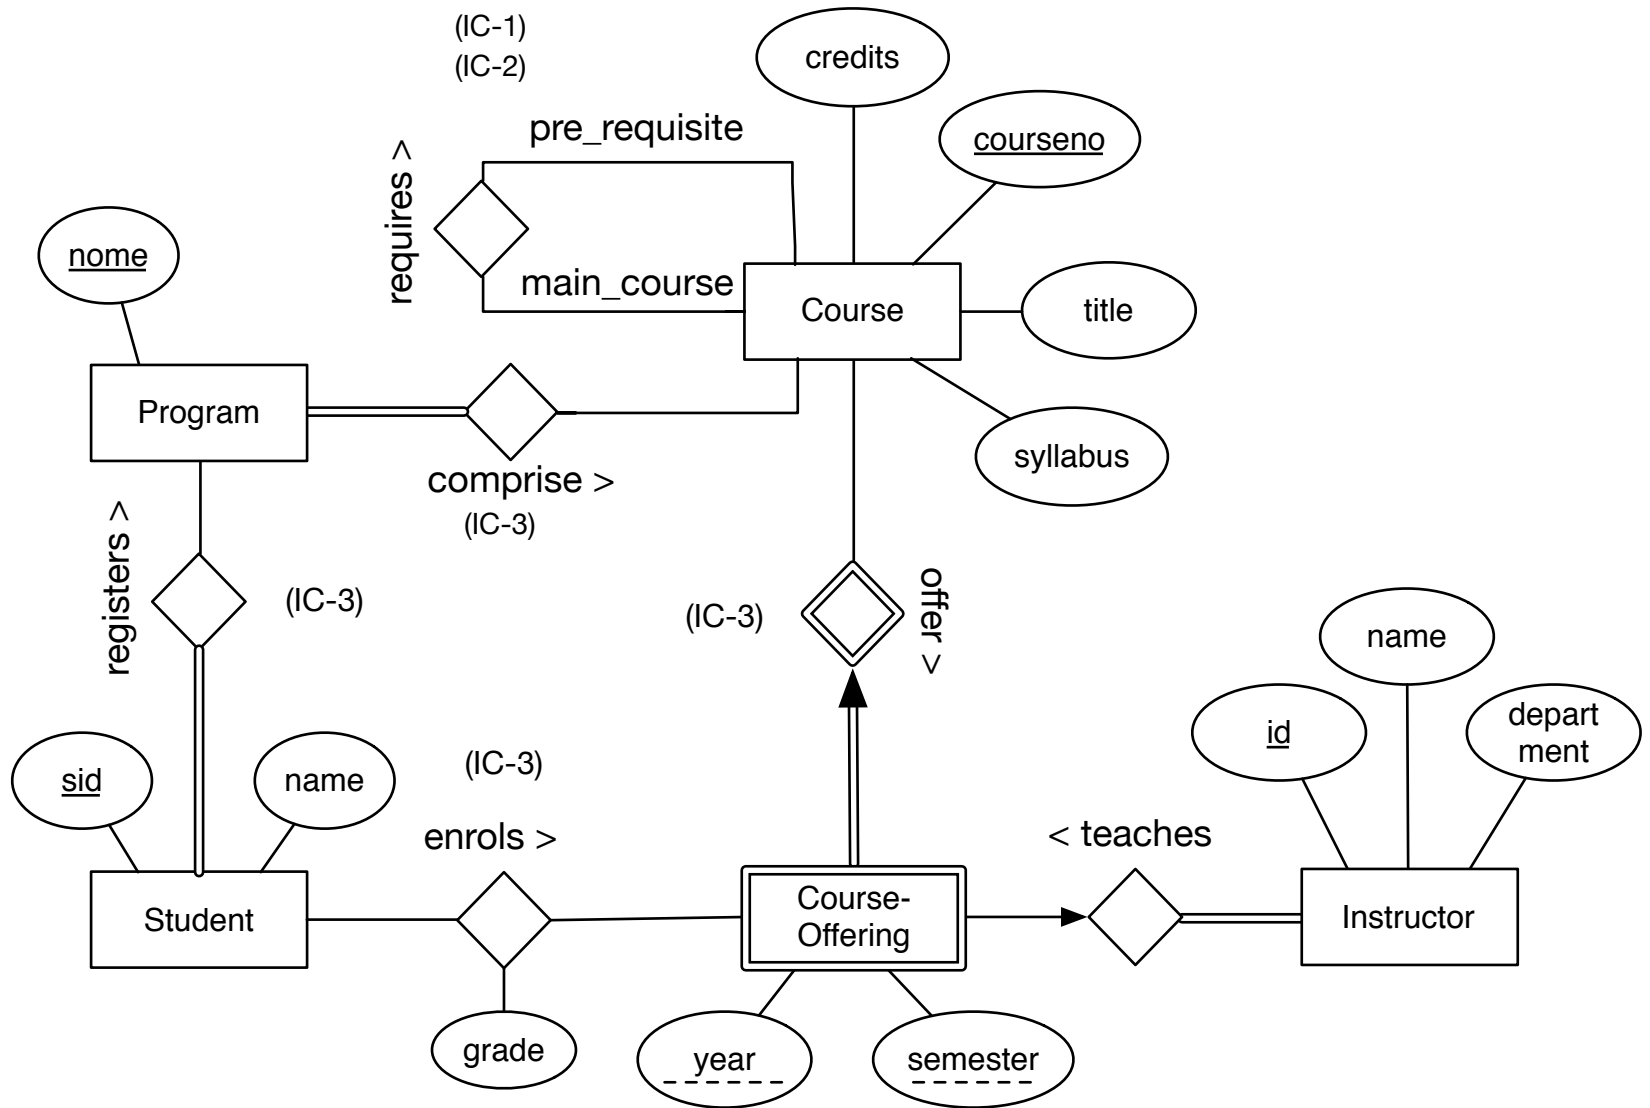

# Integrity Constraints

- ▶ **IC-8:** A Supervisor may only **supervise contracts** for Pharmacy for which he/she has been designated.

# Solution for E-A Scenario 5

# Integrity Constraints

- IC-1: A Course cannot **require** itself
- IC-2: Courses cannot **require** one another circularly
- IC-3: A Student can only **enrol** in Course Offerings **offered** from Courses **comprised** by the Program where he/she is **registered**.
